

# EVENTS

## JavaScript Events

# Announcements

2

- Use relative addresses in your assignments.
- Use the specifications on the Web.
- First test will be on Wednesday
- New Scrum Masters as of today.
- If you use short tags (e.g. `<?= $film ?>`) you need to enable it in Apache on AWS
- Please email me ([martin@cs.rochester.edu](mailto:martin@cs.rochester.edu)) your proposals tomorrow.

# First Test

3

- All questions will be about Web Programming
  - ▣ Infrastructure: AWS, Unix, Apache, Git, ...
  - ▣ HTML
  - ▣ CSS
  - ▣ PHP
  - ▣ JavaScript
- You may bring on 8.5x11 (or A4) sheet of paper with notes.
- There will be different versions of the test that will be assigned to seats.

# Short Tags

5

1. Edit `/etc/php.ini`

```
$ cd /etc
```

```
$ sudo vi php.ini
```

2. Change short tags to “On”

```
short_open_tag = On <<<Change from “Off” to “On”
```

3. Restart `httpd`

```
$ sudo /sbin/service httpd restart
```

# php.ini

6

```
;;;;;;;;;;;;;  
; Language Options ;  
;;;;;;;;;;;;;
```

```
>>>>>> snip <<<<<<<<<<
```

```
; This directive determines whether or not PHP will recognize code between  
; <? and ?> tags as PHP source which should be processed as such. It's been  
; recommended for several years that you not use the short tag "short cut" and  
; instead to use the full <?php and ?> tag combination. With the wide spread  
; http://www.php.net/manual/en/ini.core.php#ini.short-open-tag
```

```
>>>>>>> snip <<<<<<<<<<
```

```
short_open_tag = On
```

# Quiz (Question 1)

7

What do you need to add to your web page to use the “\$” function?

```
<script src="prototype.js" type="text/javascript"></script>
```

- ▣ The “\$” function is a shortcut for:
  - `document.getElementById("foo")`
  - i.e., `$("#foo")`
- ▣ It is part of the prototype library
  - <http://prototypejs.org>
- ▣ The book uses this function in a lot of its examples. Hence the question. jQuery also has a \$ function.

# Quiz (Question 3)

8

What word appear in this alert box?

```
alert("the quick brown fox".split(" ").reverse()[0]);
```

- ❑ “the quick brown fox”.split(“ “) === [“the”, “quick”, “brown”, “fox”]
- ❑ “the quick brown fox”.split(“ “).reverse() === [“fox”, “brown”, “quick”, “the”]
- ❑ “the quick brown fox”.split(“ “).reverse()[0] === **“fox”**

# Quiz (Question 4)

9

What query to `<url>` should call this code?

```
<?php
    $base = $_REQUEST["base"];
?>
```

- `<url>?base=5`
- Like exercises 3
  - `Movie.php?film=princessbride`

10

# Standup

Discuss questions with your Scrum Team

# Quiz

11

1. What object does all JavaScript run in by default?
2. Write the JS code to attach `ok()` to a button with id “ok” when the page is loaded.
3. Write a JS function that contains one line of code to handle

```
<fieldset>  
  <label><input type="radio" name="cc" value="v" /> V </label>  
  <label><input type="radio" name="cc" value="mc" /> MC</label>  
</fieldset>
```

4. What is the difference between “onclick” and “mousedown”?

12

And the answer is ...

# Quiz (Answers)

13

1. The global window object. (Slide 15)

2. Slide 16

```
function pageLoad() {  
    $("ok").onclick = ok;  
} JS
```

3. Slide 17

```
Function cc() {  
    alert(this.value + " is checked!");  
} JS
```

4. Onclick: press and release; mousedown: press only

14

# Events

# The keyword this

15

```
this.fieldName // access field  
this.fieldName = value; // modify field  
this.methodName(parameters); // call method
```

JS

- all JavaScript code actually runs inside of an object
- by default, code runs inside the global window object
  - all global variables and functions you declare become part of window
- the this keyword refers to the current object

# Event handler binding

16

```
function pageLoad() {  
    $("ok").onclick = okayClick; // bound to okButton  
here  
}  
function okayClick() { // okayClick knows what DOM object  
    this.innerHTML = "booyah"; // it was called on  
}  
window.onload = pageLoad;
```

*JS*

- event handlers attached unobtrusively are bound to the element
- inside the handler, that element becomes this (rather than the window)

# Fixing redundant code with this

17

```
<fieldset>
  <label><input type="radio" name="ducks"
value="Huey" /> Huey</label>
  <label><input type="radio" name="ducks"
value="Dewey" /> Dewey</label>
  <label><input type="radio" name="ducks"
value="Louie" /> Louie</label>
</fieldset>
```

HTML

```
function processDucks() {
  if ($("#huey").checked) {
  alert("Huey is checked!");
} else if ($("#dewey").checked) {
  alert("Dewey is checked!");
} else {
  alert("Louie is checked!");
}
  alert(this.value + " is checked!");
}
```

JS

# More about events

18

|                                  |                                 |                               |                               |   |  |                                 |
|----------------------------------|---------------------------------|-------------------------------|-------------------------------|---|--|---------------------------------|
| <a href="#"><u>abort</u></a>     | <a href="#"><u>blur</u></a>     | <a href="#"><u>change</u></a> | <a href="#"><u>click</u></a>  | <a href="#"><u>dblclick</u></a>                             | <a href="#"><u>error</u></a>                                 | <a href="#"><u>focus</u></a>    |
| <a href="#"><u>keydown</u></a>   | <a href="#"><u>keypress</u></a> | <a href="#"><u>keyup</u></a>  | <a href="#"><u>load</u></a>   | <a href="#"><u>mousedow</u></a><br><a href="#"><u>n</u></a> | <a href="#"><u>mousemove</u></a><br><a href="#"><u>e</u></a> | <a href="#"><u>mouseout</u></a> |
| <a href="#"><u>mouseover</u></a> | <a href="#"><u>mouseup</u></a>  | <a href="#"><u>reset</u></a>  | <a href="#"><u>resize</u></a> | <a href="#"><u>select</u></a>                               | <a href="#"><u>submit</u></a>                                | <a href="#"><u>unload</u></a>   |

- the click event (onclick) is just one of many events that can be handled
- **problem:** events are tricky and have incompatibilities across browsers
  - ▣ reasons: fuzzy W3C event specs; IE disobeying web standards; etc.
- **solution:** Prototype includes many event-related features and fixes

# Attaching event handlers the Prototype way

19

```
element.onclick = function;  
element.observe("event", "function");
```

*JS*

```
// call the playNewGame function when the Play button is  
clicked  
$("#play").observe("click", playNewGame);
```

- to use Prototype's event features, you must attach the handler using the DOM element
- object's observe method (added by Prototype)
- pass the event of interest and the function to use as the handler
- handlers must be attached this way for Prototype's event features to work

# Attaching multiple event handlers with \$\$

20

```
// listen to clicks on all buttons with class "control"
that
// are directly inside the section with ID "game"
window.onload = function() {
    var gameButtons = $$("#game > button.control");
    for (var i = 0; i < gameButtons.length; i++) {
        gameButtons[i].observe("click", gameButtonClick);
    }
};
function gameButtonClick() { ... }
```

*JS*

- you can use \$\$ and other DOM walking methods to unobtrusively attach event handlers to
- a group of related elements in your window.onload

# The Event object

21

```
function name(event) {  
  // an event handler function ...  
}
```

JS

- Event handlers can accept an optional parameter to represent the event that is occurring. Event objects have the following properties / methods:

| method / property name                     | description  |
|--|--|
| type                                       | what kind of event, such as "click" or "mousedown" |
| <a href="#">element()</a> *                | the element on which the event occurred            |
| <a href="#">stop()</a> **                  | Cancels an event                                   |
| CSC 210<br><a href="#">stopObserving()</a> | removes an event handler                           |

# Mouse events

22

|                                  |  |
|----------------------------------|--|
| <u><a href="#">click</a></u>     | user presses/releases mouse button on this element       |
| <u><a href="#">dblclick</a></u>  | user presses/releases mouse button twice on this element |
| <u><a href="#">mousedown</a></u> | user presses down mouse button on this element           |
| <u><a href="#">mouseup</a></u>   | user releases mouse button on this element               |

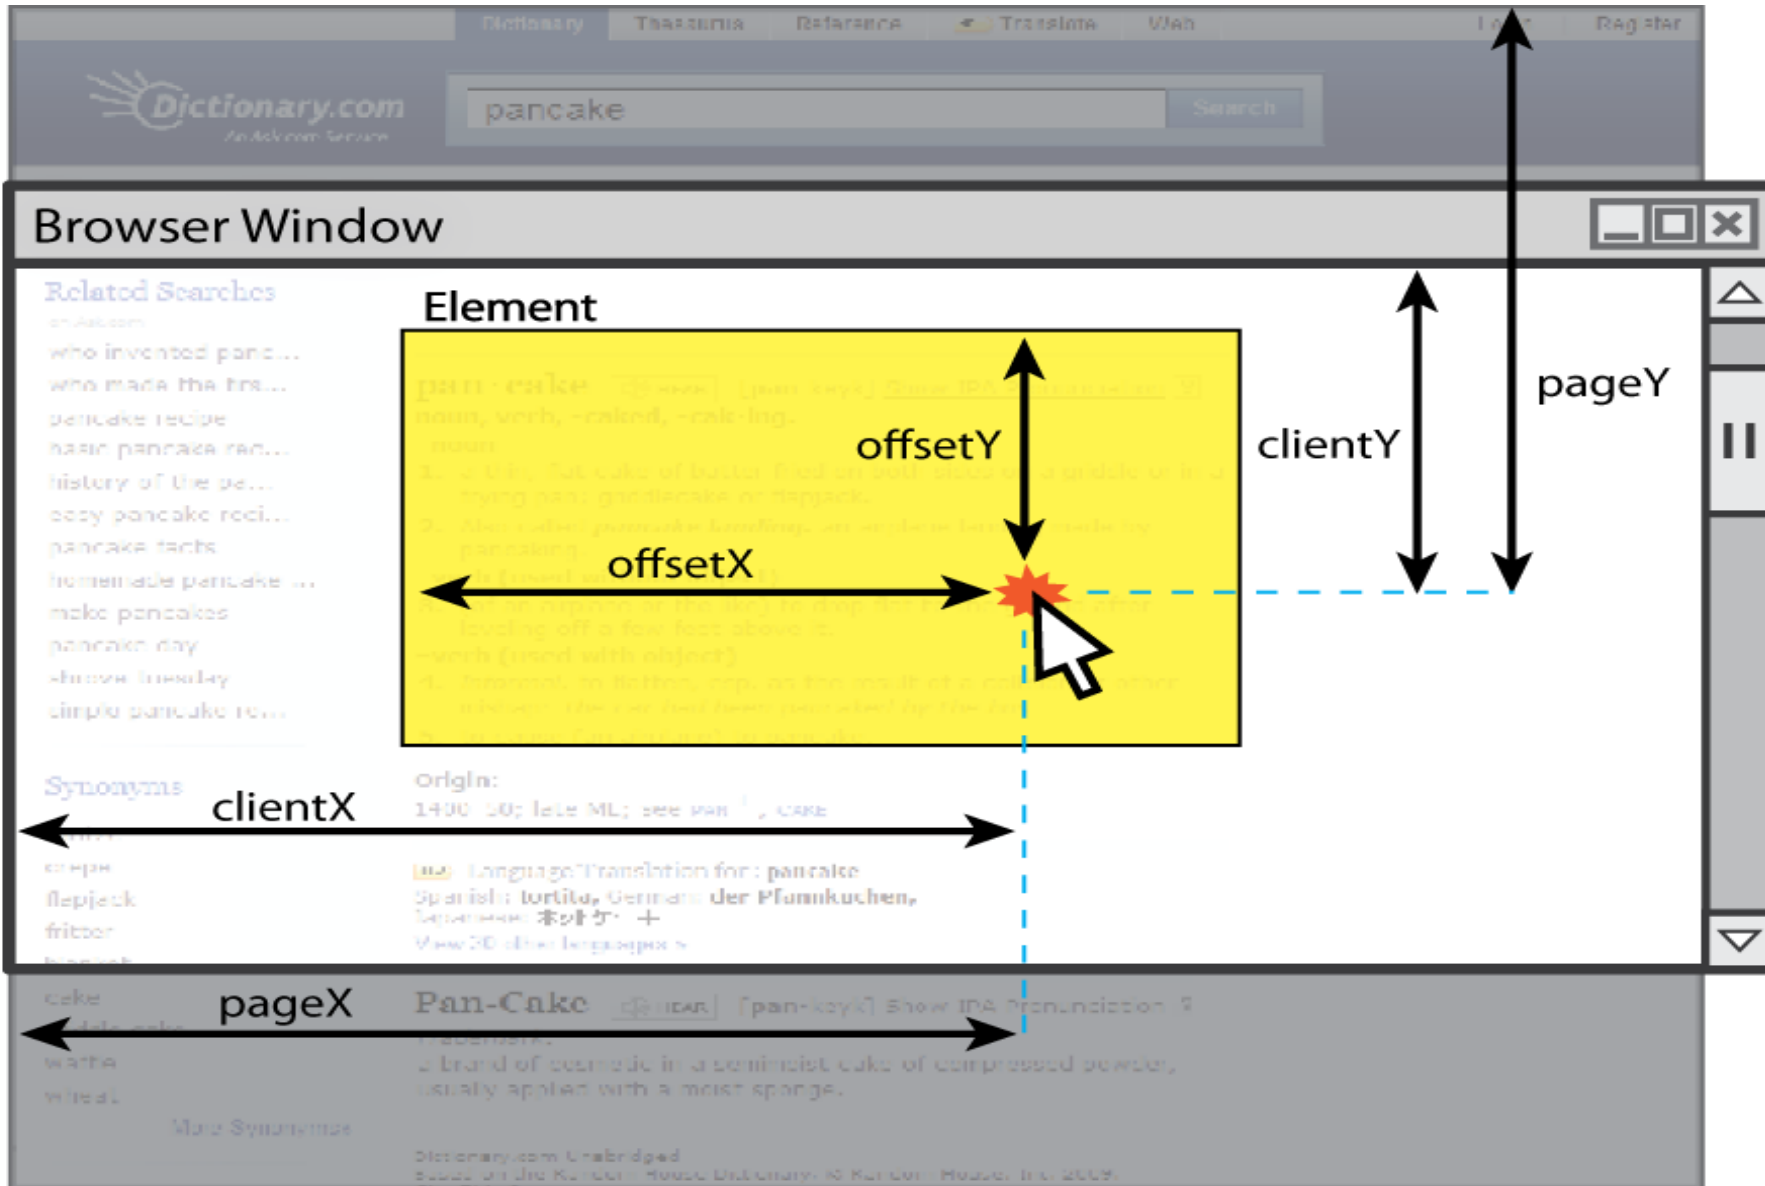

# Mouse events

23

|                  |   |
|------------------|---|
| <u>mouseover</u> | mouse cursor enters this element's box              |
| <u>mouseout</u>  | mouse cursor exits this element's box               |
| <u>mousemove</u> | mouse cursor moves around within this element's box |

# Mouse event objects

| property/method                            | description                     |
|--|---------------------------------|
| clientX, clientY                           | coordinates in browser window   |
| screenX, screenY                           | coordinates in screen           |
| offsetX, offsetY                           | coordinates in element          |
| <u>pointerX()</u> ,<br><u>pointerY()</u> * | coordinates in entire web page  |
| <u>isLeftClick()</u> **                    | true if left button was pressed |

\* replaces non-standard properties pageX and pageY

\*\* replaces non-standard properties button and which

# The Event object

26

```
<pre id="target">Move the mouse over me!</pre>
```

*HTML*

```
window.onload = function() {  
    $("target").observe("mousemove", showCoords);  
};  
function showCoords(event) {  
    this.innerHTML =  
        "pointer: (" + event.pointerX() + ", " +  
event.pointerY() + ") \n"  
        + "screen : (" + event.screenX + ", " +  
event.screenY + ") \n"  
        + "client : (" + event.clientX + ", " +  
event.clientY + ")";  
}
```
